EDUCATION

FAST NUCES — Karachi, Pakistan

Expected May 2028

Bachelor of Science in Computer Science

CGPA: 3.68 / 4.0 · Dean's List (3 Semesters)

Relevant Coursework: Data Structures & Algorithms, OOP, Operating Systems, Database Management Systems, Artificial Intelligence, Probability & Statistics.

TECHNICAL SKILLS

Languages: JavaScript, Python, C++, SQL

Frontend & Backend: React.js, Next.js, FastAPI, Node.js

ML & AI: LLM APIs, (basic understanding of vector Databases, embeddings and RAG.)

PROJECTS

NexusFinance — Shariah-Compliant Financial Portal *Next.js · MySQL*

Github: <https://github.com/Jawad-Ahmed-S/NexusFinance>

- Built a two-sided Islamic banking portal where managers create and manage Mudarabah cycles, track profit/loss, and trigger settlements — while users handle deposits and inter-account transfers.
- Designed the database schema around Shariah contract rules, enforcing them through SQL triggers rather than relying on application-level validation.
- Set up role-based authentication via NextAuth separating user and manager access throughout the portal.

Multi-Vendor Ecommerce Platform *React.js · Node.js · Express · MongoDB · Socket.io · Stripe · TanStack Query*

Github: <https://github.com/Jawad-Ahmed-S/MULTI-VENDOR-ECOMMERCE>

- Built a full-stack marketplace connecting independent sellers with customers, supporting product listings, carts, orders, and store management across three services (frontend, backend, real-time socket server).
- Implemented role-based access control (user / seller / admin) via authentication and authorization middleware.
- Used TanStack Query on the frontend for server-state caching and synchronization alongside Redux Toolkit (with redux-persist) for persisted client-side state like cart and auth.
- Integrated Stripe Checkout for payments with Cash-on-Delivery as a fallback method.
- Built real-time buyer–seller chat with a dedicated Socket.io service, backed by conversation/message models tracking unread counts per side.

AI-Powered Fake Job Detection System *Python · FastAPI · scikit-learn · React.js*

Github: <https://github.com/Jawad-Ahmed-S/Job-Description-Classifer>

- Built a tool that analyzes job postings for fraud, returning a verdict with a human-readable explanation of why the posting looks suspicious.
- It has hybrid fraud-detection system for job postings using TF-IDF (5,000 features) and a Random Forest classifier (200 trees), trained on a dataset of 13,000 postings (12,500 Real, 500 Fake).
- Addressed severe class imbalance (96:4) by applying SMOTE on the training set while preserving the original imbalanced distribution in the test set to reflect real-world conditions.
- Designed a confidence-based logic gate to route ambiguous predictions (ML probability 0.20–0.60) to a Groq-hosted Llama-3 model for secondary review, reducing false negatives on disguised or evolving scam patterns.
- Achieved 98% testing accuracy with F1-scores of 99% (Real) and 83% (Fake) on held-out, real-world-distributed test data.
